NOTES AND METHOD

Carbon-tax liability. Estimated tax for the year: sum of per category: net tCO2e ×(1 - applied allowances) ×rate.

Grades present: Final, estimated-grade pending CS1.

Check passed: The bridge sums to the assessment's liability. sum of category rand R 23,568,160.00 = R 23,568,160.00.

Check passed: Each category: net ×taxable share = taxable tonnes; taxable ×rate = rand. Rate 308 R/tCO2e.

Method: Section 6 of the Carbon Tax Act as the assessment worked it (engine ct4-section-6-1): per category, net tonnes ×(1 - allowances applied, capped at the aggregate) ×the rate. The liability is the snapshot's own total; nothing is recomputed here.
